a large number of physical phenomena are modeled by nonlinear partial differential equations subject to appropriate initial boundary conditions these equations in general do not admit exact solution the present monograph gives constructive mathematical techniques which bring out large time behavior of solutions of these model equations these approaches in conjunction with modern computational methods help solve physical problems in a satisfactory manner the asymptotic methods dealt with here include self similarity balancing argument and matched asymptotic expansions the physical models discussed in some detail here relate to porous media equation heat equation with absorption generalized fisher's equation burgers equation and its generalizations a chapter each is devoted to nonlinear diffusion and fluid mechanics the present book will be found useful by applied mathematicians physicists engineers and biologists and would considerably help understand diverse natural phenomena

throughout the book emphasis has been laid on developing the concepts clarifying the units to be used in final equations and neatly presenting solutions for the numerical problems the

features of this one stop book will help the students to prepare themselves for taking up the design papers taught in higher classes key features1 use of si units 2 summary of important concepts and formulae at the end of the book3 large number of solved problems presented systematically4 large number of exercise problems 5 simple and clear explanation of concepts 6 generous use of diagrams for better understanding7 includes university question papers
